

• JANSEVA-X

From citizen intent to completed government application.

Intent

Consent

Completion

Intent-first. Consent-based. Officer-controlled.

The citizen should not have to learn the system before using it.

Every extra step turns a simple public service into a test of patience, memory, and persistence.

- 01 **Deadlines become pressure.**
Urgency rises when the next step is unclear.
- 02 **Repeated fields create frustration.**
Document hunting slows everything down.
- 03 **Queues add uncertainty.**
Without clear status, citizens are left waiting and wondering.

The burden is not just paperwork.
It is uncertainty at every step.

The need is simple. The journey is fragmented.

A straightforward request becomes a sequence of portals, requirements, documents, and repeated data entry.

01

Find the right portal

The first challenge is knowing where to begin.

02

Understand requirements

Guidance is scattered before the application even starts.

03

Gather documents

Proof, forms, and records must be assembled manually.

🔄 Then the same information is entered repeatedly — across disconnected steps.

Tell JANSEVA-X what you need.

From navigating portals to completing an intent-led public-service journey.

01

Intent replaces portal hunting

Citizens describe the outcome they need; JANSEVA-X routes the application.

02

Consent keeps control visible

Every next step is clear, deliberate, and owned by the citizen.

→ One guided journey. The right service, at the right moment.

What JANSEVA-X actually does

A guided public-service journey from citizen intent to officer-owned completion.

01 · UNDERSTAND

Start with intent

Citizens explain what they need in their own words, by voice or text.

- Service discovery made simple
- Guided routing to the right service

02 · PREPARE

Build with consent

JANSEVA-X prepares the application and smartly assembles the right attachments.

- Consent stays visible and explicit
- Fewer gaps before submission

03 · COMPLETE

Move to resolution

Citizens draft, track, and complete requests with clear officer ownership.

- Status stays easy to follow
- Every request has an owner

From “I need a service” to a complete application journey.

A guided flow that keeps the citizen informed, in control, and moving forward.

The application, unfolding step by step

Citizen-led journey

01 · Intent

Start with the service the citizen came for.

02 · Assist

Consent, Smart Fill and Smart Attach reduce effort.

03 · Complete

Verify identity, create a ticket, then choose.

The service does the heavy lifting.

Consent first

The citizen understands and authorises assistance.

Smart assistance

Information and documents move with less friction.

Control stays human

Submit now—or keep the application as a draft.

A complete journey, not just a digital form.

Preparation starts only when the citizen says yes.

Consent is the gate. Intelligence prepares the application — it never takes control away.

Citizen consent

- ✓ Consent gates Smart Fill.
- ✓ Consent gates Smart Attach.

The citizen decides when preparation begins.

Prepared application

- Citizen stays in control.
- Application intelligence, not document storage.

Less repetition. Clearer ownership.

The system prepares only after permission — and the citizen remains the final authority.

Smart Fill + Smart Attach

Two guided steps that reduce citizen effort while keeping the officer in control.

Smart Fill

Prepares form fields from the citizen's stated intent, making the next step clearer and faster.

- Intent → ready-to-review fields

Smart Attach

Matches the required documents to the service, so citizens know what to provide before submission.

- Requirement → matched documents

Verification is visible, deterministic and clearly marked as a prototype.

A guided synthetic journey — from document capture to face and biometric demos.

Prototype sequence

01 Mock Aadhaar + mock PAN

02 Mock e-KYC + face demo

03 QRfingerprint + five-finger scan

● Demo state

Synthetic-only by design.

The prototype makes its verification boundary impossible to miss.

- ✓ Mock documents and demo biometrics only
- ✗ No real government provider is contacted

Safe to present, inspect and repeat.

→ Every state is visible before the next step begins.

A BETTER STARTING POINT

A guided government application journey — from home.

Turn intent into progress, with the right support at every step.

Less effort. More confidence.

Less portal hunting

Find the right service from one clear starting point.

Less repetitive entry

Prepare information once, then move forward with ease.

Guided through verification

Know what is needed, where you stand, and what comes next.

A calmer path from application to completion.

AI assists the officer. The officer owns the final decision.

A guided workflow keeps advisory intelligence in service of accountable public decisions.

01

Submission enters the queue

The request is ready for accountable review.

02

Officer claims and reviews

The officer examines the submission with context.

03

AI advises. Officer decides.

Approve, correct, or reject remain officer decisions.

Approve Correct Reject

AI provides advisory support — accountability stays with the officer.

One application. Two experiences. One shared state.

The same lifecycle keeps citizen progress and officer action aligned from intent to completion.

Citizen

A clear path from intent to completion.

- Intent becomes an application
- Consent and verification build confidence
- Completion is visible and understandable

Human-facing progress, without the black box.

Officer

A focused path from queue to decision.

- Queue shows what needs attention
- Evidence arrives in context
- The officer owns the decision

Decision support, never decision replacement.

→ Shared lifecycle state links both sides.

AI connects — it does not decide.

How it is built

Two service journeys, one shared foundation — designed for citizen trust and officer ownership.

One foundation, two experiences

The architecture keeps complexity behind the scenes.

Citizen frontend + backend

A guided public-service journey from intent to completion.

Shared state layer

PostgreSQL + Prisma keep every handoff consistent.

Employee frontend + backend

JANSEVA AI, mock verification, and PWA-ready workflows.

Trust moves with the case — from citizen consent to employee action.

Built around consent, ownership and controlled lifecycle states.

Every request is checked at the point of access, action and transition.

Identity & authority

The right actor, with the right permission.

JWT authentication

Reject unauthenticated requests and inactive accounts.

Role + ownership validation

Confirm role authorization and resource ownership.

State & boundary controls

Safe transitions, isolated execution.

Lifecycle validation

Allow only valid, controlled state transitions.

Idempotency + isolation

Protect documents and isolate mock-provider behavior.

Control is explicit at every trust boundary.

Consent → verify → own → transition

A reusable layer for clearer, more guided service journeys.

One service foundation that guides citizens today and expands across government workflows tomorrow.

01

For citizens

Less friction

Clearer status from intent through completion.

02

For government

Structured review

Advisory AI supports review while officers retain ownership.

03

Future roadmap

More services

A reusable layer designed to extend beyond one journey.

 **Current prototype**

Synthetic and mocked — a foundation for validation, not a deployment claim.

JANSEVA-X

Government services should understand citizens.

Tell JANSEVA-X what you need. We will help you get it done.
